

1 **ABSTRACT OF THE DISCLOSURE**

2 An air gun with a quick-releasing device has a body, a head tube
3 attached to the body and a detachably functional tip, wherein the quick-
4 releasing device is attached to a distal end of the head tube to secure the
5 detachably functional tip. The quick-releasing device has a slit defined in the
6 distal end of the head tube to communicate with an inner space of the head
7 tube, a locking sheet movably received inside the slit to partially enter the
8 inner space of the head tube, and a locking lever pivotally mounted on the
9 head tube to drive the locking sheet to move in a vertical direction. Thereby,
10 the locking sheet is allowed to leave the inner space of the head tube when a
11 user presses the locking lever to enable easy release of the attached
12 functional tip and then to exchange the original tip for another functional tip.
